

原本在試 sample code 的時候，一直跑出跑出封包無法抵達

[illegible]

之後問同學是把註解的地方改掉就好

結果如下：

The screenshot shows a Kali Linux desktop with a purple-themed window manager. Two terminal windows are open. The left terminal window displays a list of IP addresses and their corresponding port 5000 connections, with some showing 'Recv' and 'Send' data. The right terminal window shows the output of a netstat command, displaying a list of active connections, including the same IP addresses and port 5000 connections, along with the state of the connections (e.g., ESTABLISHED, TIME_WAIT).

Short summary:

多宣告一個 host 暫存路徑，把 route 每 5 秒根據 true or false 換一次，當不是第一條路徑時，將路徑改向另一個 host
